

React Components: The 3 ways.

[Everything you need to know.]

@gulraizcodes

With Classes

React class based components are the bread and butter of most modern web apps built in ReactJS.

```
import React from "react";

class App extends React.Component
{
  render() {
    return <h1>@gulraizcodes</h1>;
  }
}

export default App;
```

With Function

Example of a Functional Component in React defined as App which returns JSX:

```
import React from 'react';

function App() {
  const greeting = 'Hello Gulraizcodes!';

  return <h1>{greeting}</h1>;
}

export default App;
```

With Arrow Function

Arrow-Functional components are kind of similar to the functional components with a small difference.

```
import React from 'react';

const App = () =>{
  return(
    <div>
      Something here.
    </div>
  );
}

export default App;
```
