What is Polymorphism?

Polymorphism is the ability of an object to take on many forms.

The most common use of polymorphism occurs when a parent class reference is used to refer to a child class object.

Polymorphism

many

forms

Real Life Example

- In Shopping mall behave like customer
- In Bus behave like Passenger
- In School behave like Student
- At home behave like son

Method Overloading

Save a new Contact

With 1 number

`createContact(name,num)`

With 2 numbers

`createContact(name,num1,num2)`

saadaslam.net/linkedin

Overriding vs Overloading

Overriding

```
class Dog{
    public void bark(){
        System.out.println("woof ");
    }
}
class Hound extends Dog{
    public void sniff(){
        System.out.println("sniff ");
    }

    public void bark(){
        System.out.println("bowl");
    }
}
```

Same Method Name,
Same parameter

Overloading

```
class Dog{
    public void bark(){
        System.out.println("woof ");
    }

    //overloading method
    public void bark(int num){
        for(int i=0; i<num; i++)
            System.out.println("woof ");
    }
}
```

Same Method Name,
Different Parameter
